Preliminary results

Longer duration of speciation

Mean nLTT statistic for different duration of speciations

$\Delta_{nLTT} = 0.0111 + 0.00108 t_{spec}$ $R^2_{adj} = 0.053$

RJC Bilderbeek (University of Groningen)

TECE progress meeting

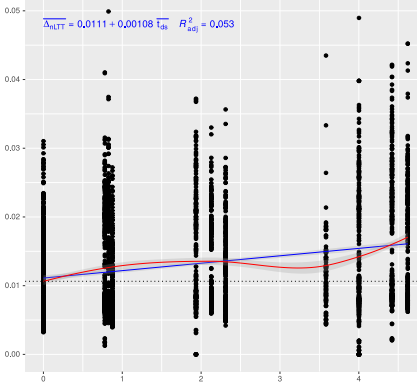

2017-09-13

13 / 33

Preliminary results

Longer DNA alignments

Mean nLTT statistic for different duration of speciations

$\Delta_{nLTT} = 0.0163 + 0.00158 t_{spec}$ $R^2_{adj} = 0.12$
 $\Delta_{nLTT} = 0.00609 + 0.000609 t_{spec}$ $R^2_{adj} = 0.14$

15 / 33

Preliminary results

Longer duration of speciation

Mean nLTT statistic for different expected mean duration of speciation, for different DNA alignment lengths

$\Delta_{nLTT} = 0.0163 + 0.00158 t_{spec}$ $R^2_{adj} = 0.12$
 $\Delta_{nLTT} = 0.00609 + 0.000609 t_{spec}$ $R^2_{adj} = 0.14$

Parameter estimation

then for $\lambda \rightarrow \infty$, becomes

- λ : speciation rate
- μ : extinction rate

if $t \geq 16 : 00$, then done

☺THANKS! ☺

Current problem

RJC Bilderbeek (University of Groningen)	TECE progress meeting	2017-09-13	22 / 33
	Work in progress		

Parameter estimation

takes a

A	A	A	A	A	A	A	A	A	A	A_1
A	C	C	C	A	C	C	C	A	C	B
A	C	C	C	A	C	G	T	A	C	C

 and creates

a distribution of $\{\mathcal{T}, \hat{\lambda}, \hat{\mu}, \hat{t}_0, \}$

- \mathcal{T} : a phylogeny
- $\hat{\lambda}$: estimated speciation rate
- $\hat{\mu}$: estimated extinction rate
- \hat{t}_0 : estimated crown age

Work in progress

Naive expectation

Parameters to create phylogenies:

λ	speciation rate	0.3
μ	extinction rate	0.2
t_0	crown age	15

Expected parameter estimates:

$\hat{\lambda}$	estimated speciation rate	0.31	0.29	0.28
$\hat{\mu}$	estimated extinction rate	0.19	0.21	0.2
\hat{t}_0	estimated crown age	14.9	15.1	15.2

RJC Bilderbeek (University of Groningen)TECE progress meeting2017-09-1325 / 33

Work in progress

Real results

Parameters to create phylogenies:

λ	speciation rate	0.3
μ	extinction rate	0.2
t_0	crown age	15

Parameter estimates:

birthRate2	18.591	23.7402	16.1756	22.7706	24.0203
relativeDeathRate2	0.69492	0.3817	0.60621	0.49113	0.29777
TreeHeight	0.1515	0.14719	0.14579	0.15033	0.1514

RJC Bilderbeek (University of Groningen)TECE progress meeting2017-09-1326 / 33

Work in progress

relativeDeathRate2

Parameters to create phylogenies:

λ	speciation rate	0.3
μ	extinction rate	0.2
t_0	crown age	15

Parameter estimates:

b	birthRate2	18.59	23.740	16.176	22.771	24.020
d	relativeDeathRate2	0.6949	0.382	0.6062	0.4911	0.2978
z_0	TreeHeight	0.152	0.1472	0.1458	0.1503	0.151

Hypothesis:

$$d = \frac{\mu}{\lambda} \approx 0.67$$

RJC Bilderbeek (University of Groningen)TECE progress meeting2017-09-1327 / 33

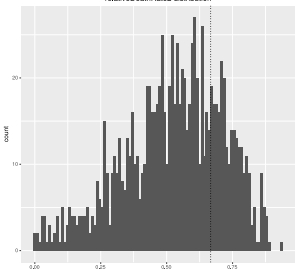

Work in progress

relativeDeathRate2

@Description("Birth Death model based on Gernhard 2008.
" +
"This derivation conditions directly on fixed N taxa.
" +
"The inference is directly on b-d (strictly positive) and d/b (constrained in [0,1])
" +
"Verified using simulated trees generated by Klass tree sample. (http://www.klaashartmann.com/treesa

final public Input<RealParameter> relativeDeathRateParameterInput =
new Input<>("relativeDeathRate", "relative death rate parameter, mu/lambda in birth death model")

relativeDeathRate2 distribution

RJC Bilderbeek (University of Groningen)TECE progress meeting2017-09-1328 / 33

Work in progress

birthRate2 and TreeHeight

Parameters to create phylogenies:

λ	speciation rate	0.3
μ	extinction rate	0.2
t_0	crown age	15

Parameter estimates:

b	birthRate2	18.59	23.740	16.176	22.771	24.020
d	relativeDeathRate2	0.6949	0.382	0.6062	0.4911	0.2978
z_0	TreeHeight	0.152	0.1472	0.1458	0.1503	0.151

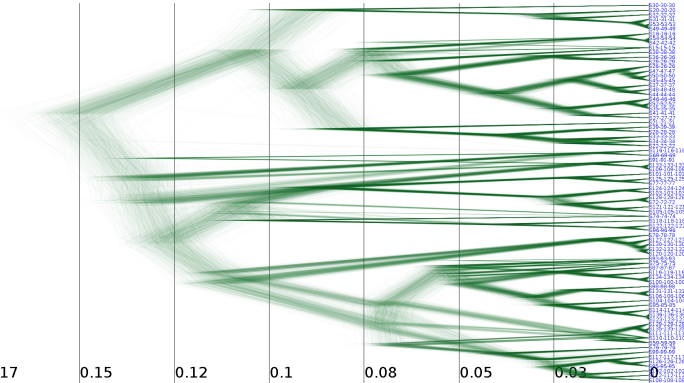

Hypothesis ☹:

$$b = \lambda - \mu = 0.1$$
